

## i-Chain Fixed Asset Management

Issue 1, June 2018

### Managing your assets effectively requires qualified professionals

This week we start focusing on our **Unique Verification Technology**.

i-Scan is an in-house developed application system created specifically for the purposes of creating and/or verifying of asset registers. It easily integrates with existing Asset Management Systems via common data loading files. This essentially means that i-Scan can plug into your asset register and assist you with the verifications.

The technology makes use of modern, smart devices (iPods) to offer you the most advanced, convenient way to verify your assets.

Our system is web-based and will allow you to securely connect to your data from any location you choose. Most clients use our hosting option ensuring that their data is secure and automatically backed up at all times. This also eliminates any special hardware requirements and keeps the cost ownership down.

i-Scan allows you to very effectively and efficiently scan a barcode, capture the relevant site specific details against the barcode and download the data into any suitable register format or asset management system for reporting and control.

### i-Chain specialises in all services and products relating to **Fixed Asset Management**

The question is, why would you need our services?
